

Wellbore Fishing & Rental Tools

Eliminator System

The **Eliminator System** has been developed to reduce the number of trips involved in washing over a wide range of equipment installed in the wellbore. Items to be retrieved include, but may not be limited to perforation guns, sand screens, production tubing or packers. By offering the ability to latch the fish, perform the washover, and retrieve the fish in a single trip, significant cost reductions may be achieved.

In addition the **Eliminator System** places the retrieved equipment at a set point in the workstring upon retrieval, thereby eliminating multiple strings across the well control equipment.

Applications:

- Vertical or Deviated Wells
- Deep or Shallow Wells
- Utilizes Premium Washpipe Connections

Features

- Inner string utilizes proven concepts in packer retrieving tools.
- A variety of conventional fishing tools may be used to latch the fish.
- Control Bushing is threaded to match the washover string.
- Latch Bushing provides a connection between the Inner String and the Washover String.

Benefits

- No additional trips required, single trip washover and retrieval
- Surface handling of **Eliminator System** optimized for safety on the rig floor.
- Should the washover shoe require replacement, the Outer String can be retrieved leaving the connection to the fish intact.
